

# Case Study

## PROBIOTIC WOUND CARE SPRAY HEALS CAT BITE

Veterinary surgeon trials wound spray on his own pet cat

### Novel Wound Management Results

- ✓ Six painful, inflamed puncture wounds heal in 7 days.
- ✓ Temperature resolves in 24 hours.
- ✓ No further treatment required.
- ✓ No complications have since occurred.

## PROBIOTIC WOUND SPRAY HEALS CONTAMINATED CAT BITE *WITH* PROBIOTICS AND *WITHOUT* ANTIBIOTICS

### Problem

A vet's 8-month old cat, Mila, was involved in a cat fight and sustained bite wounds at the base of her tail and right forelimb. She had a temperature of 40.1°C and was in moderate to severe pain. She had four deep puncture wounds in the base of her tail, and two deep puncture wounds on her forearm, all penetrating the muscles and tendons. The base of her tail and forearm were inflamed.

### Solution

The affected areas were:

- Clipped and cleaned with Chlorhexidine antiseptic (contact time approximately 5 minutes).
- Rinsed fully with tap water and dried.
- Sprayed with **Provilan LUCAA+ Wound Care Spray** twice daily for 7 days.

Mila was also treated with opioids for pain control in the early stages. No attempt was made to reduce the local inflammatory response with anti-inflammatory treatment.

### Results

Mila's temperature returned to normal after 24 hours. The swelling persisted for 4 days and resolved by 7 days post treatment. No further treatment was necessary and no complications have occurred since.

### Conclusion

Mila is fully recovered and healthy.

"The wounds healed uneventfully. This case demonstrates a novel and effective way of managing contaminated wounds".
